Re-Loop

Solving the First-Mile Collection Problem for Household E-Waste via Gamified Reverse Logistics.

The "Drawer of Doom"

Millions of tons of valuable e-waste are trapped in our homes simply because driving to a specialized recycling center is too much friction.

The waste exists, and the recycling infrastructure exists. The bottleneck is the **first-mile collection**.

By relying on consumer goodwill and proactive transport, the current model guarantees failure for micro-electronics.

The Solution: Reverse Gig Logistics

1. Easy Listing

Users open the app, snap a quick photo of their tangled cables, dead chargers, or old phones, and instantly request a pickup from their doorstep.

2. Hyperlocal Pickup

Gig workers (e.g., delivery drivers returning from a drop-off) are routed to pick up the bag of electronics, completely removing friction for the user.

3. Instant Rewards

Instead of paying for pickup, users earn digital cash, sustainability points, or brand discount coupons, gamifying the recycling process.

Dual Revenue Streams

Bulk Material Scrap

We aggregate thousands of small, low-value individual pickups into massive, high-value tons of copper, plastic, and circuit boards. We then sell these aggregated materials directly to certified, large-scale refineries at premium commodity rates.

B2B EPR Compliance

Hardware brands are legally mandated to fund e-waste recycling (Extended Producer Responsibility). We charge these mid-to-large consumer tech brands a premium fee to collect and verifiably recycle e-waste on their behalf to meet government targets.

Highly Profitable Unit Economics

~60%

Gross Margin per Pickup

Financial Breakdown (Per Pickup)

- **Gross Revenue:** ₹240 – ₹420 (from bulk scrap + EPR fees)
- **Direct Costs:** ₹100 – ₹140 (Driver payout + customer rewards)
- **Net Profit:** ₹140 – ₹280 per pickup

By reaching city-scale density (12,000 pickups/month), the model projects a **₹30L – ₹50L Net Profit** in Year 1.
